METHOD OF AUTOMATICALLY EVALUATING IMAGES BEING PROCESSED IN A PHOTOGRAPHIC LABORATORY SYSTEM

ABSTRACT OF THE DISCLOSURE

Images being processed in a photographic laboratory system into
different forms of output are automatically evaluated to determine for each image
whether it is of sufficient quality to merit processing into a selected form of output.

Each image is individually evaluated by determining a grade value for each of one or
more characteristic properties of the image, by assigning a target value to each of
the characteristic image properties relative to each available form of output, and by
comparing the grade value to the target value for a selected form of output.
